

Abstract

A workpiece, the product thereof, and a kit, for making simulated stained glass works of art includes a transparent sheet covered on one side by an opaque scratch-removable 5 coating and on the other side by a second sheet having transparent-ink patterns or solid colors. Portions of the opaque coating are removed to reveal through the transparent substrate, underlying transparent-ink patterns. The partially scratched product "drawing" produces an excellent visual 10 appearance simulative of stained glass when held up to light. The finished product can be affixed to a window for continued enjoyment.
